MAYOR'S BRIEFING

The demand for public water infrastructure investments persists even though local government continues to substantially increase investments nearly every year for the last five decades. Cities are facing dual responsibilities to reinvest in an aging infrastructure to sustain services and public health, and to comply with long term obligations under water mandates. Sometimes these needs compete for scarce resources in a city.

Cities have expressed concern over costly consent agreements regarding sewer overflows and long term control plans, and nutrients impacting water quality that are regulated as total maximum daily loadings (TMDLs) into receiving water bodies. The United States Conference of Mayors (USCM) and its Mayors Water Council (MWC) has urged EPA to exercise greater flexibility when imposing compliance mandates to lessen the financial burdens on customers; and also because sewer overflow and TMDL consent agreements are so costly that they compete with reinvestment in current water infrastructure and other essential public services such as public safety, road repairs and maintenance programs and other local priorities.

Cities in this study exhibit already high levels of cost per household for public water services. Measured by actual household income rather than MHI, this study underscores the fact that many of the communities are experiencing both widespread and substantial (and sustained over time) financial impacts in below median income households.

Growth in regulatory compliance requirements that continue to emerge from EPA in silo fashion ignores the cumulative and distributive costs to households. Household costs are largely irrelevant under the water laws; and especially due to the way EPA assesses affordability at the local level (i.e., indexing the affordability threshold to the more affluent median income household, and then expecting below median income households to bear a disproportionate financial burden in rate setting).

California cities were asked to provide information on the average annual cost per household for water, sewer and flood control. The cost per household involves only the residential customers. Current cost levels represent the cumulative costs over time to the present, but do not reflect future costs, particularly anticipated rate increases required to address emerging TMDL compliance standards.

We compared actual cost per household in over 30 California cities, 28 of them clustered in Los Angeles County, to EPA's affordability criteria under the Clean Water Act (CWA) and Safe Drinking Water Act (SDWA) regulatory programs, both indexed to Median Household Income (MHI) (2.0% MHI under CWA; 2.5% MHI under the SDWA). For the purposes of this research 4.5% MHI is used as a combined affordability measure. These criteria have become our focus because their intended purposes are set to measures against which EPA might find economic burdens that do not relieve cities of their obligations, but could be used to justify greater flexibility over the terms and timeframes for compliance.

When EPA affordability criteria regarding stormwater and sewer overflow costs exceed 2% of MHI in a community, the Agency will consider greater flexibility. Generally speaking, EPA affordability criteria are seldom reached when estimates are based on MHI, a relatively poor measure of burden on below median income households.

There are different levels of financial distress based on where a household is on the income distribution: if a median income household experiences financial distress when water and sewer costs exceed 4.5% of their income, the severity of that distress for a below median income household is substantial and should trigger greater flexibility. Cities in this study exhibit already high levels of cost per household for public water services. Measured by actual household income rather than MHI, this study underscores the fact that many of the communities are experiencing both widespread and substantial (and sustained over time) financial impacts in below median income households.

Major Findings

Public Water Cost per Household in the Surveyed Cities is Already High

- Total public water cost per household ranges from $366 to $2,640/yr, (Table A).
- Median total cost per household is $1,172/yr.

  ◊ Annual median water costs at $902/yr are four times sewer costs.
  ◊ Sewer cost per household is $199/yr (median).
  ◊ Flood Control cost per household is $41/yr (median).

- Cost per household in 4 cities exceed one standard deviation above average:

  ◊ La Canada Flintridge $ 2,640
  ◊ Sierra Madre $ 2,040
  ◊ La Verne $ 1,936
  ◊ Escondido $ 1,730

Substantial Economic Burdens on Below Median Households

- As expected, households with high income spend a lesser percentage of annual income on public water.
- When EPA applies the MHI as the economic burden indicator it masks the distributional cost impacts on below median income households (Table C). The severity of economic burden is found in the lower income decile groups which are virtually hidden by using the MHI indicator.
- The difference between 4.5% of actual income and 4.5% of MHI can be considerable:

  ◊ Sacramento has a relatively large population coupled with high public water costs and therefore the lower median income households are paying roughly $29 million/yr over 4.5% of actual income.

- This financial impact is masked by using just MHI as the affordability threshold.
- Over a 10-year period the lower median income households are carrying a $293 million financial burden.

  ◊ Escondido has 34% of its households in a 148,738 population city with spending that exceeds 4.5% of actual income:

- Annually, these households spend a combined $12.1 million in excess of 4.5% of their actual income.
- Over a 10-year period the financial burden is $122 million.

  ◊ Eleven of the study area communities have 10-year period financial burdens above $10 million borne by the lowest income households.

- More than half of the cities in the study exhibit excessive public water spending based on actual income, and the dollar amount of excessive spending is substantial, (Table C).

Widespread Economic Burdens on Households

- Comparing Actual Cost per Household to MHI Criteria provides a way to calculate how widespread the substantial economic burden is- measured by the percent of a city's households that carry a substantial economic burden.
- Total public water cost per household ranges from slightly to substantially greater than 4.5% of actual household income across the household income distribution deciles as described below:

  ◊ Eleven cities report combined water, sewer and flood control costs per household in excess of 4.5% of annual income for 20% or more of households.

  ◊ Paramount, La Verne and Escondido households exceed the 4.5% of actual income by 39%, 35% and 34%, respectively.

- Thirteen cities exceed spending 4.5% of actual income for 10 to 18% of their households.
- Six cities exceed spending 4.5% of actual income for 4 to 9% of their households.
- Three cities have less than 4% of households not spending in excess of 4.5% of their actual annual income on public water.

Introduction and Statement of Purpose

Lower income households spend a greater percentage of their annual income on public water services than households with median or higher income, and the disparate financial impact is not adequately taken into account by EPA when setting compliance levels and timeframes.

The United States Conference of Mayors (USCM) and its member cities have been engaged with the US Environmental Protection Agency (EPA) concerning the affordability of local public water services and federal/state mandates associated with current water laws. USCM member cities have expressed concern over costly consent agreements regarding sewer overflows and long term control plans, and nutrients impacting water quality that are regulated as total maximum daily loadings (TMDLs) into receiving water bodies. The USCM and its Mayors Water Council (MWC) has urged EPA to exercise greater flexibility when imposing compliance mandates to lessen the financial burdens on customers; and also because sewer overflow and TMDL consent agreements are so costly that they compete with reinvestment in the aging current water infrastructure and other essential public services such as public safety, road repairs and maintenance programs and other local priorities. During the course of these discussions it became clear from focusing on how EPA assesses local affordability that the current cost per household for public water services impacts households differently from a financial perspective based on actual household income. Lower income households spend a greater percentage of their annual income on public water services than households with median or higher income, and the disparate financial impact is not adequately taken into account by EPA when setting compliance levels and timeframes.

EPA developed affordability guidelines for certain regulations under the CWA[1] and SDWA[2]. The guidelines include an algorithm for estimating whether marginal (additional) expenditures necessary to achieve compliance would exact a substantial and widespread economic burden on the community. Regulations under the SDWA are based on national cost estimates, but EPA has stated that a new drinking water regulation can be implemented if the cost to household customers does not exceed 2.5 percent of median household income (MHI)[3]. Guidelines developed by EPA for use in CWA enforcement efforts regarding stormwater and sewer overflows considers a long term control plan to be affordable if the cost to household customers does not exceed 2.0 percent of MHI. MHI, the one common characteristic of the 2 guidelines, may be intended to stretch national and local efforts to achieve the goals of the CWA and SDWA, but its unintended consequence is a disparate financial burden on below median income households as a regressive tax. Households under the poverty level and under MHI pay a disproportionate share of their annual incomes for public water compared to the

1. U.S. EPA. 1997. Guidance for Financial Capability Assessment and Schedule Development
2. U.S. EPA. 2002. Affordability Criteria for Small Drinking Water Systems: An EPA Science Advisory Board Report. EPA-SAB-EEAC-03-004. U.S. Environmental Protection Agency, Washington, DC.
3. Affordability criteria considered by EPA under the SDWA pertains to setting national drinking water standards on a national basis. Using 2.5% of MHI to assess affordability for small community drinking water systems is intended to determine if a variance is appropriate.

affluent households (median and above median income households) in a community. EPA's insistence on using affordability criteria indexed to MHI creates a class-based environmental injustice. While there are good arguments for wanting and expecting greater levels of water quality and safe drinking water, there are limited resources in below median income households, and limits to overall local government resources. The clearly disproportionate and unfair financial impact on below median income households is a problem that EPA and Congress should be aware of and do something about.

EPA's insistence on using affordability criteria indexed to MHI creates a class-based environmental injustice.

This report has four purposes: first, it is intended to generate information on the current cost per household for public water services (sewer, water, flood control/stormwater). This is accomplished via a multi-community survey that collects and reports the current average annual cost per household in dollars and as a percent of annual household income according to different household income levels. The second purpose of the report is to compare current cost per household to EPA affordability criteria, taking into account the cost per household on all income levels. Third, this information is important to cities because it provides a profile of where current costs are, and how future investments, whether for system renewal or for regulatory compliance, or both, will impact the cost per household. It also makes a compelling argument for greater federal financial support for local governments, which has been reduced in a time where regulatory requirements have been increasing. Fourth, the study provides a framework for permit writers to consider the affordability of permit programs when considering compliance levels and deadlines.

Community Survey Information and Analysis

The data used in this report are gathered from participating communities regarding water costs, and from Census data at census.gov[4]. The USCM's Mayors Water Council collaborated with a number of California and Los Angeles County cities via an on-line survey. We choose Los Angeles County since it is one of the first areas in the nation to be regulated under a federal TMDL Consent Decree for stormwater. Additional California communities participated in the survey from outside of Los Angeles County.

Cities were asked to provide information on the average annual cost per household for water, sewer and flood control. The cost per household involves only the residential customers. Current cost levels represent the cumulative costs over time to the present.

Census information was collected for each participating city, and includes data on population, poverty rate, median household income (MHI), and the number of households per income category. The Census reports income for 10 income level categories (deciles)[5].

Current public water cost per household information provides the city with an accurate measure of how much households spend across the income distribution. Any additional costs for renewal, expansion or increased compliance requirements can be compared to the 2014 cost as a benchmark. Current costs are not static, and public water rates are rising in many cities around the nation. Cities in the survey are facing substantial new financial responsibilities related to compliance with Total Maximum Daily Loads, and there will likely be additional CWA/SDWA mandates as EPA continues to develop regulations in silo fashion over time.

The key findings are presented in the next section. Appendix A includes information on the distribution of cost per household across the income spectrum for each survey city. Appendix B provides comments on bias, estimation and uncertainty identified and considered in the survey and presentation of data.

---

4. See Table A
5. The ten categories of household income are: $10,000 or less; 10,001 to 14,999; 15,000 to 24,999; 25,000 to 34,999; 35,000 to 49,999; 50,000 to 74,999; 75,000 to 99,999; 100,000 to 149,999; 150,000 to 199,999; and, 200,000 plus. For analytical purposes these categories are represented by the mid-point of income, except for the lowest income decile which is set at $10,000.00, and highest income decile which is set at $200,000.00.

Results

I: The Current Cost per Household for Public Water Services in the Survey Cities: (See Tables A & B)

A. Average Annual Water Cost per Household All Water Services (sewer, water and flood control)

- Total public water cost per household ranges from $366 to $2,640/yr
- Median total cost per household is $1,172/yr
  - ◊ Annual median water costs at $902/yr are four times sewer costs.
  - ◊ Sewer cost per household is $199/yr (median).
  - ◊ Flood Control cost per household is $41/yr (median).

- Cost per household in 4 cities exceed one standard deviation above average for total public water costs
  - ◊ La Canada Flintridge $ 2,640
  - ◊ Sierra Madre $ 2,040
  - ◊ La Verne $ 1,936
  - ◊ Escondido $ 1,730

- There is a wide range of current cost per household for all public water services
  - ◊ San Marino has the lowest at $366 annual average cost
  - ◊ La Canada Flintridge has the highest at $2,640/yr

B. Drinking Water Cost per Household

- Drinking water cost per households ranges from
  - ◊ Low $115/yr in San Marino
  - ◊ High of $2,245/yr in La Canada Flintridge

- The median Drinking Water cost per household is $902, and it is four times greater than the median Sewer cost per household at $199.

C. Sewer

- Sewer cost per household ranges from
  - ◊ $12/yr a year in Monterey Park
  - ◊ $738/yr in Sierra Madre

- The median cost per household is $199/yr

D. Flood Control

- Flood control cost per household ranges from
  - ◊ $0 in Azusa
  - ◊ $351/yr in South Gate

- The median cost per household is $41/yr

II: EPA Affordability Criteria Indexed to MHI Masks Substantial and Widespread Financial Impact (See Table B)

When EPA affordability criteria regarding stormwater and sewer overflow costs exceed 2% of MHI in a community, the Agency will consider greater flexibility. Generally speaking, EPA affordability criteria are seldom reached when estimates are based on MHI, a relatively poor measure of burden on below median income households.

For example, in the study area the median 2% of MHI for the cities is $1,352, but the median cost for sewer and flood control (CWA) is only $240. Similarly, the median combined water, sewer and flood control cost per household in the study cities is $1,171, and does not come close to the median 4.5% of MHI of cities at $3,042. Consent decrees involving local investment, from this mathematical vantage point, appear affordable with ample unused margin and no perceived substantial or widespread economic burden on the community.

When actual household income levels are considered in the affordability determination it becomes clear that MHI, as the presumptive critical criteria, masks the financial impact on lower income households.

Estimating affordability based on MHI results in financial burdens on below median income households because they pay a disproportionate share of their annual incomes. Drilling down into the cost per household as a percent of actual income reveals the disparate financial impact on below median income households.

City of Sierra Madre

- 2% MHI in the City of Sierra Madre is $1,806; and average annual sewer costs are $738, or about 40% of the 2% MHI affordability criteria. The affordability of a project does not appear to be an economic burden when the MHI serves as the critical metric.
- 18% of households are estimated to be paying in excess of 2% of their actual annual income on sewer.
    - ◊ The excess sewer payments are felt by households earning up to $35,000/yr.
- Another 8% of households, 26% in all, exceed 2% of actual income when adding flood control to sewer cost per household.
- Potential affordability obligation of EPA criteria
    - ◊ 2% MHI in Sierra Madre is equal to 18% of actual income for households with in come of $10,000/yr.
    - ◊ 4.5% MHI ($4,064) is equal to 40% of actual income in $10,000/yr households.

City of Sacramento

- 2% MHI in the City of Sacramento is $1,013; and average annual sewer costs are $617, or about 61% of the 2% MHI affordability criteria.
- 36% of households pay in excess of 2% of annual income for sewer
    - ◊ The excess sewer payments are felt by households earning up to $35,000/yr.
- Potential affordability obligation of EPA criteria
    - ◊ 2% MHI in Sacramento is equal to 10% of actual income for households with income of $10,000/yr.
    - ◊ 4.5% MHI ($2,279) is equal to 23% of actual income in $10,000/yr households.

If EPA triggers consideration of regulatory flexibility when the median income household experiences a substantial economic burden, then the same trigger should apply when water and sewer costs impose a substantial economic burden on the below median income household.

III: Substantial Economic Burdens on Below Median Households

If EPA triggers consideration of regulatory flexibility when the median income household experiences a substantial economic burden, then the same trigger should apply when water and sewer costs impose a substantial economic burden on the below median income household. It is possible to quantify the regressive nature, and amount, of economic burden to determine if it is substantial. This study uses 4.5% of MHI and 4.5% of actual annual income to measure the severity of economic burden (or, excessive spending by households) that results from using MHI as the critical metric.

A spectrum from mild to severe financial distress was found in households in most cities in the study. As expected, households with high income spend a lesser percentage of annual income on public water.

The severity of economic burden depends on where a household is on the income distribution. The study area communities exhibit substantial financial burdens that are sustained over time due to the recurring need for water and sewer services and the growing cost per household.

Estimates are generated of how much money a household spends in excess of 4.5% of actual income to gauge the severity of economic burden. The excess cost per household can then be multiplied by the number of households in each income category to estimate the magnitude of sustained economic burden.

- As expected, as income increases excessive spending decreases. (Table C).
- Lower median income households can experience a substantial financial burden (spending in excess of 4.5% of actual income).

Regulations developed under the separate silos of CWA and SDWA do not adequately consider the economic burden associated with overall public water and wastewater costs. Consideration of total public water costs are a more accurate depiction of the true household and community affordability, and of potential economic burdens and how widespread those burdens are.

◊ Sacramento has a relatively large population coupled with high public water costs and therefore the lower median income households are paying an estimated $29 million/yr over 4.5% of actual income

» This financial impact is masked by using just MHI as the affordability threshold.
» Over a 10-year period the lower median income households are carrying a $293 million financial burden when using actual income versus MHI.

◊ Escondido has 34% of its households in a 148,738 population city with spending that exceeds 4.5% of actual income.

» Annually, these households spend a combined $12.1 million in excess of their 4.5% of actual income
» Over a 10-year period the financial burden is $122 million

- Seventeen of the study area communities have 10-year period financial burdens above $10 million

- Two cities (Monterey Park, San Marino) have sewer, water and flood control costs below $500/year; and do not currently have households paying in excess of 4.5% of their actual annual incomes.

IV: Widespread Economic Burdens on Below Median Households

Water costs are on average four times higher than sewer costs in the survey communities. It is common for communities in arid regions to have this relationship between sewer and water services. Looking at combined water, sewer and flood control costs per household serves to demonstrate that different combinations of water costs and their associated mandates can vary considerably by community. Regulations developed under the separate silos of CWA and SDWA do not adequately consider the economic burden associated with overall public water and wastewater costs. Consideration of total public water costs are a more accurate depiction of the true household and community affordability, and of potential economic burdens and how widespread those burdens are.

- Eleven cities report combined water, sewer and flood control costs greater than 20% of households pay in excess of 4.5% of annual income.

Paramount	39.4%
La Verne	35.3%
Escondido	34.4%
Lomita	29.6%
Santa Barbara	27.9%
South Gate	26.4%
Sierra Madre	26.2%
Sacramento	24.3%
Arcadia	23.8%
Alhambra	22.1%
Claremont	21.1%

- Thirteen cities report combined water, sewer and flood control costs per household exceeding 4.5% of actual income for 10 to 20% of their households.

Downey	18.2%
Redondo Beach	17.6%
South Pasadena	17.3%
Norwalk	17.0%
La Canada Flintridge	14.7%
Bell Gardens	14.5%
La Mirada	14.0%
Glendora	12.6%
Signal Hill	11.6%
Pomona	11.5%
Bellflower	11.1%
Manhattan Beach	10.9%
Azusa	10.1%

- Six cities report combined water, sewer and flood control costs per household exceeding 4.5% of actual income for 4 to 8% of their households.

San Gabriel	8.0%
Torrance	8.0%
Diamond Bar	7.9%
San Dimas	7.7%
Lakewood	5.4%
Monrovia	4.4%

- Two cities (Monterey Park and San Marino) did not report any households paying over 4.5% of their annual income on combined water, sewer and flood control services.

- Three cities do not have data available to calculate excess cost per household, (Bradbury, Inglewood and Vernon).

V: EPA Affordability Criteria Exposure for Below Median Income Households (See Table C)

Public water customers (households) may be required to spend more money to address mandates imposed by EPA under the CWA and the SDWA, as well as assume responsibility to cover normal cost of service and any upgrades required to provide service. The affordability index of 2% MHI is used by EPA to assess the appropriateness of CWA requirements, but only some of them. Similarly, the SDWA use of 2.5% of MHI does not address all public drinking water systems, and it is likely that new mandates or new interpretations of what is required under existing mandates puts the rate payer household at a long-term financial disadvantage.

- The median of 2% MHI for the study cities is $1,352
- The median of 4.5% MHI for the study cities is $3,042

- Two cities currently have public water costs per household that nearly reach 4.5% of MHI, and experience both substantial and widespread economic burdens

	Combined Water Cost per Household	4.5% MHI	Households Impacted	10-Year Impact
• Paramount	$1,439	$1,987	39.4%	$27 mill
• South Gate	$1,171	$1,883	26.4%	$29.8 mill

- Three cities have statistically high exposure to higher public water costs because they are wealthy communities measured by MHI

	2% MHI	4.5% MHI
• La Canada Flintridge	$3,099	$6,972
• Manhattan Beach	$2,688	$6,050
• San Marino	$2,782	$6,260

1. Water and sewer averages are based on 14 units of consumption which may be high for lower income households, (Ray Yeghyayan, City if Inglewood, CA., September 2014); due to the limited number of hook-ups in Inglewood that are serviced by the city it is too complex to match cost per household to hook-ups that represent the entire city, which is why Tables 2 and 3 were not done.

Vernon, CA

Population, 2013: 112

Poverty Rate, 2012: NA

Median Household Income (MHI), 2012: NA

EPA Affordability Criteria
2% of MHI: NA
4.5% of MHI: NA

Current Average Cost per Household	
Sewer	$ 158.00
Water	$ 422.00
Flood Control	$
Total	$ 580.00

Appendix B *Bias, Estimation and Uncertainty*

Generally speaking, the estimates developed in this study are accurate and reliable. All studies, however, are subject to several forms of error and uncertainty. This Appendix is intended to address some of the potential for estimation error regarding this study method and application.

Data Bias:

- Data on population, Median Household Income and number of households for income deciles is taken directly from the latest Census reports at Census.Gov. These data enjoy the accuracy achieved by the Census survey data techniques; and they suffer the same deficiencies of such.
- Cities participating in the survey are self-selected for whatever reason they chose to participate. This introduces an element of bias because not all cities are included. Therefore, the findings may be somewhat indicative of all California cities but are best seen as representing the survey cities involved rather than all California cities.

Estimation:

- Estimating the dollar amount of Median Household Income at 2.0% and at 4.5% is straightforward arithmetic and not subject to estimation error, other than the inherent error involved with the Census' calculation of estimated Median Household Income for each city involved.

- Estimating the percent of households impacted by cost per household and comparisons to current costs and affordability criteria is also straightforward arithmetic, but has several factors that are identified as possibly introducing estimation error.

  ◊ In order to estimate the percentage of households that spend in excess of 4.5% of their actual income on public water the analysis applied relies on some assumptions

- This research relies on city expertise to provide cost per household data for sewer, water and flood control. Cities have a practical advantage in knowing these residential costs by virtue of their recurring experience with water and sewer billing over time, and an intimate knowledge of their customer base.

- Local expertise is involved in matching number of households to local service hook-ups. These figures often do not match, primarily because in multi-household dwellings a single hook up may service a small to large number of households that reside in the units. Again, local expertise is relied on to confirm the accuracy of the estimates.

- In one city, Inglewood, the local expertise of a city official intimate with system operations asserted that the difference between household number and hook-ups could not be easily resolved. This is the case because many households in Inglewood are served by another regional system. Therefore, the data for Inglewood exhibited in the results are limited to the cost per household provided by the city, and the estimation of 2.0% and 4.5% of Median Household Income. That same Inglewood representative also cautioned that the consumption rates for the poorer households might be overestimated.

Error:

Systemic error may affect the calculation of estimates when using number of households, but there are countervailing factors that may minimize the importance of error in this instance. For example, the lowest and highest income deciles are, respectively, $10,000 or less a year, and $200,000 or more a year. The convention used for the purposes of this study was to assign all households in this category to an assumed income of $10,000, when some households in this category might make less. Similarly, for the highest income category $200,000 annual income was used although these households might make more than that.

The other income deciles were utilized by specifying the mid-point of income for each category. Thus, the second lowest income decile $10,000 to $14,999 is represented for purposes of calculation as $12,500.

An additional error concern is the fact that some cities could not determine cost per household when their households were served by multiple water or sewer systems. Cities were asked to apply local expertise in these cases.

The Mayors Water Council (MWC) provides a forum for Mayors to discuss issues impacting how they provide safe, adequate and affordable water and wastewater services and infrastructure in America's Principal Cities in the 21st Century. It is open to all Mayors, focusing on water resource issues, including: watershed management; water supply planning; surface and sub-surface water infrastructure financing and rehabilitation; water conservation, Public-Private Partnerships; and asset management.
